About

I started as a complete beginner, and Git and GitHub did not make sense from tutorials alone. I kept going, one stage at a time: Git, Docker, GitHub Actions, then AWS.

Today I deploy real projects for developer teams. I write the Dockerfile, set up the pipeline, put the app behind HTTPS and fix what breaks along the way. I like working in small, verified steps and I document what I do so a team can pick it up after me.

Based in
Karachi, Pakistan

Focus
Docker, CI/CD, cloud deployment

Languages
English, Urdu

Open to
Freelance and remote DevOps work

Skills

Containers

- Docker and Dockerfiles

CI/CD

- GitHub Actions workflows

- Docker Compose
- Docker Hub image publishing

- Build, test, push, deploy
- Health checks and rollback

Cloud

- AWS: EC2, IAM, ECR, ECS Fargate, RDS, Secrets Manager, Amplify
- Oracle Cloud (OCI)

Servers and networking

- Linux (Ubuntu, Oracle Linux), SSH
- Caddy and HTTPS
- Firewalls and security groups

Version control

- Git and GitHub
- Branching and pull requests
- Repository secrets

Troubleshooting

- Memory-limited servers
- Build and migration errors
- Reading logs to find root causes

Work

J.M.S web app

React, TypeScript, Vite, Node, Express, Prisma, PostgreSQL

- Deployed the frontend and backend live on a free Oracle Cloud VM with HTTPS through Caddy.
- Built two GitHub Actions pipelines that push images to Docker Hub and deploy over SSH.
- Connected the backend to a hosted PostgreSQL database and fixed Prisma schema and migration issues with the dev team.
- Found that random server hangs came from a scheduled job running out of memory, and fixed them.

Vursell AI sales platform

Next.js, FastAPI, PostgreSQL, Redis, ARQ workers

- Took a full stack from a private repo to live on a 1 GB Oracle Cloud server, at zero cost.
- Added frontend and backend CI/CD with tests, security scans, Docker Hub publishing and SSH deploy.
- Stabilized the API on low memory by tuning workers and cleaning disk space.
- Locked Postgres and Redis to localhost to harden the setup.

Voice agent on AWS

ECR, ECS Fargate, RDS, ElastiCache, Secrets Manager, Amplify

- Built and pushed the backend image to ECR and ran it on ECS Fargate with a task definition and service.
- Created the RDS PostgreSQL database, Redis, security groups and log groups.
- Stored 27 app settings in Secrets Manager and worked within a strict least-privilege IAM setup.
- Deployed the landing page on AWS Amplify with a CI build check and a custom domain.

BMS on AWS EC2

EC2, Ubuntu, Docker

- Launched an EC2 server in the free tier with a key pair and a locked-down security group.
- Installed Docker and set up SSH access for the backend deployment.

Python HTTP server

Python, Docker, GitHub Actions

- Containerized a pure Python HTTP server and deployed it with its own CI/CD pipeline.

Experience

Freelance DevOps Engineer

2026 to present

- Deploying projects for developer teams on AWS and Oracle Cloud.
- Setting up CI/CD, containers and HTTPS for production-style delivery.

DevOps Engineer in training

2026

- Finished the Git, GitHub and GitHub Actions stages.
- Finished Docker and Docker Compose, including a multi-container FastAPI and PostgreSQL app.
- Learned AWS fundamentals: EC2, IAM, S3, ECS and the AWS CLI.

Self-taught learner

Where it started

- Began as a complete beginner in programming and DevOps.
- Followed a structured DevOps path and practiced on real projects.
